Notes:

- The device can only be driven with the supply voltage connected to the pins as shown. The positive output will increase with increasing pressure applied to the package.
- Tested on a sample basis.
- Never exceed 6.5 V supply voltage under any operating conditions.
- Tested on a sample basis.
- Proof pressure is defined as the maximum pressure to which the device can be taken and still perform within specifications after returning to the operating pressure range.
- Burst pressure is the pressure at which the device suffers catastrophic failure resulting in pressure loss through the device.
- Tested on a sample basis.
- The device can only be driven with the supply voltage connected to the pins as shown.
- Determined by measurements taken between -40°C and 85°C.
- Defined as best fit straight line.
