# **MDM3051S-GP**

# **Intelligent Pressure Transmitter**

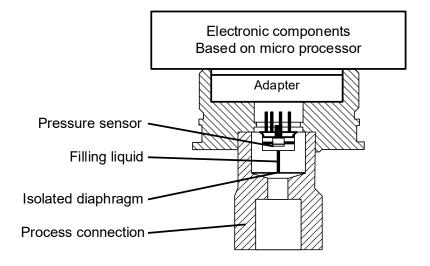

#### **Brief Introduction**

Gauge Pressure Transmitter (GP)

- Measured media: gas, steam, liquid
- Measured range (with no shift): 0mbar~6mbar...600bar
- Basic error: ±0.075%
- Diaphragm contacting with liquid: Stainless Steel 316L, Hast-alloy

# **Working Principle**

Pressure transmitter includes two functional units:

- 1. Main unit
- 2. Auxiliary unit

Main unit includes sensor and process connection, working principle as followed:

Through corrugated, isolated diaphragm and filling oil, process media is pressurized to diaphragm of pressure sensor. The other end of pressure sensor diaphragm is connected to the air (for gauge measurement) or vacuum(for absolute measurement). In such way, it makes the resistor of sensor die change so that the detection system outputs different voltage. The output voltage is in proportion to the pressure variation, and then it is transmitted to standard output by adapter and amplifier.

#### **MDM3051S-GP Pressure Transmitter**

MDM3051S series gauge pressure transmitter is used for level, density, pressure and flow measurement of liquid, gas and steam. Then it will output 4mA~20mA DC HART signal and also it could be connected to MS-HART375 handing communicator or RSM295 Modem to do the specification setting and process control.

#### **Standard Specification**

(Standard zero as the reference calibration range, Stainless steel 316L diaphragm, filling liquid is silicone oil).

# **Performance Specification**

Reference Basic error for range calibration(including linearity, hystersis and repeatability from zero): ± 0.075%.lf TD>10 (TD=Max.Pressure range/calibration range), the Basic error is ±(0.0075×TD)%The Basic error of square root output is 1.5 times of above reference Basic error.

#### Pressure range limit

The pressure is adjustable within the upper and lower limit.

It is recommended to choose the range code with the lowest pressure range proportion to optimize the performance specification.

#### Zero setting

The zero and pressure range could be adjust to any value within the measured rang in the table, only the calibrated range ≥ Min.Range is valid.

#### Mounting position effect

The change of mounting position parallel to diaphragm could not influence the zero drift. If the angle between mounting position and diaphragm is over 90°, the zero drift is <2.5mbar for range C and <1.5mbar for other ranges which could be calibrated by zero setting. No other effect on pressure range.

#### Output

2- wire, 4mA~20mA DC, HART communication protocol, linearity or square root output optional. Output signal limit: Imin=3.9mA,Imax=20.5mA.

#### Response time

The damping constant of amplifier parts is 0.1s, time constant of sensor is 0.1s~1.6s, which is depended on the pressure range and pressure range proportion. The additional adjustable time constant is 0.1s~60s.

#### Warm-up time

< 15s

### **Environmental temperature**

-40°C ~85°C

With LCD display and viton sealing ring, the temperature is -20°C ~65°C.

# Storage temperature/ transportation temperature

-50°C ~85°C; with LCD display: -40°C ~85°C.

#### **Pressure limit**

It is from vacuum to Max. Pressure range.

#### Notes

- 1. A degree: performance is normal within the technical standard range during testing;
- 2. B degree: During testing, the function or performance is lowered or lost temporarily, but it could be recovered by itself. Actual operation state, storage and data will keep the same.
